Who We Are

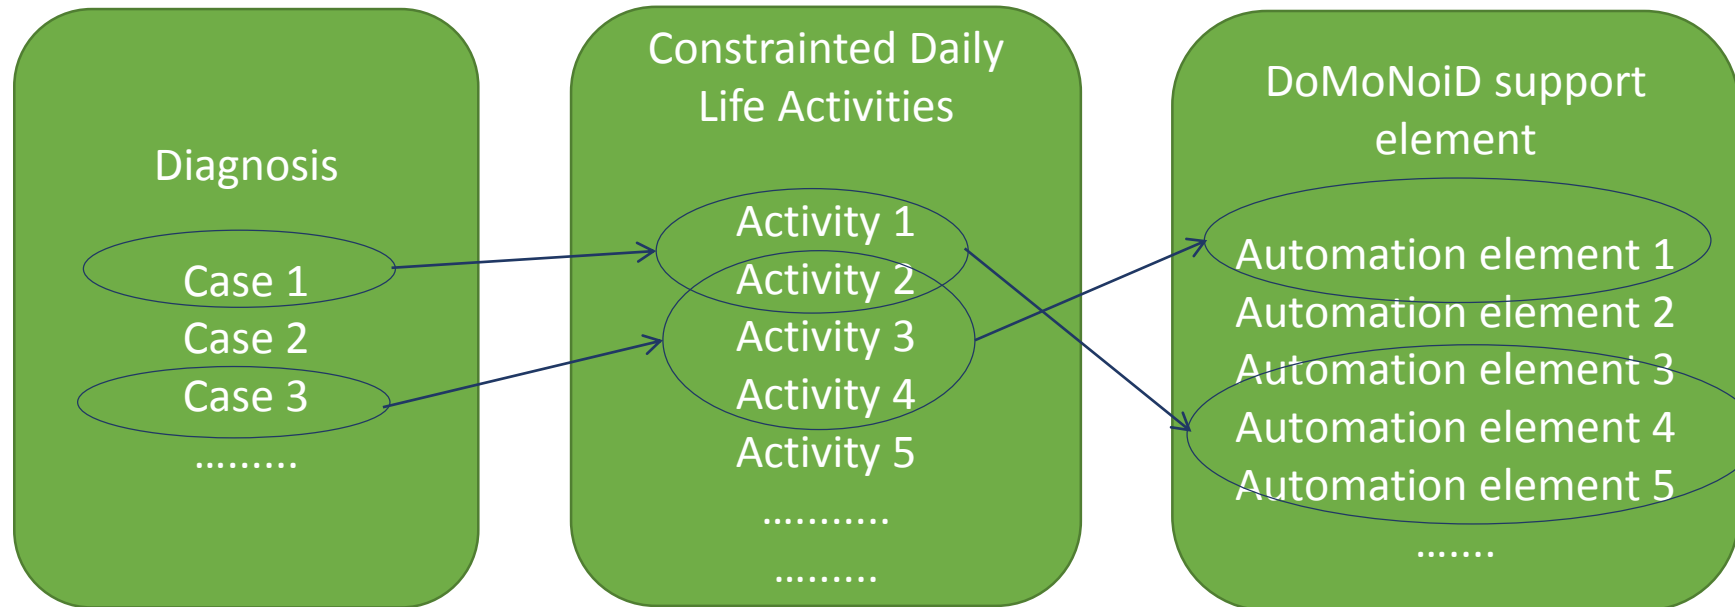

We are a Dutch SME conducting research and development activities in several ICT domains, ranging from healthcare to manufacturing systems.

Our mission is to create innovative ICT solutions to empower human beings to better organize their lives in an increasingly complex world. For this purpose, we have created numerous software tools and hardware devices, which are commercialized via our daughter companies.

Currently, we are involved in several European and Dutch funded projects together with dozens of industrial and academic partners.

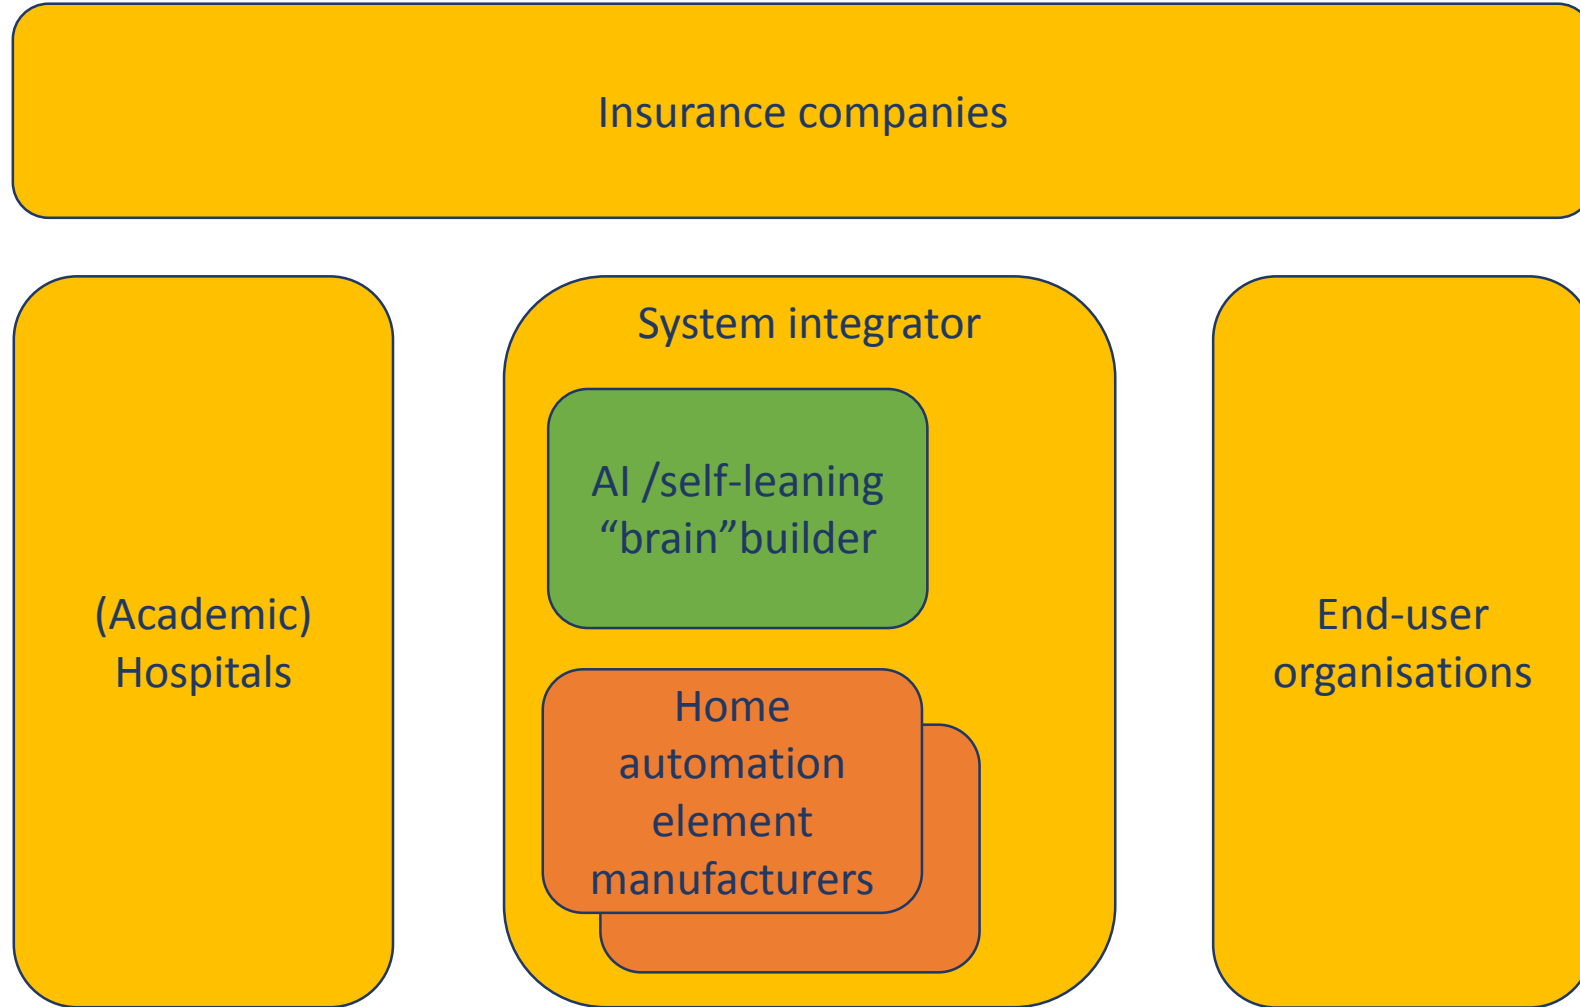

Project idea

Taxonomy of

- Dementia Diagnosis
- daily life activities
- home automation elements standard catalogue

Summarized: the basis idea is to establish a process that links validated medical diagnosis of physical and mental capabilities of elderly to an inventory of simple day-to-day occupations that need or do not (*yet!*) need assistance, and to compose a catalogue of standard robotic and home automation elements that matches this diagnosis with a comprehensive and affordable package that will provide for this tailor-made assistance.
